

A
MINI PROJECT REPORT
ON
“ACCOUNTS DATABASE-PAYROLL GENERATION SYSTEM”

Submitted in the partial fulfillment of the requirements in the 3rd semester of

BACHELOR OF ENGINEERING
IN
INFORMATION SCIENCE AND ENGINEERING

BY
AKHILA S
(1NH17IS008)

Under the guidance of

Prof. Prakruthi ST
Assistant Professor
Dept. of ISE, NHCE

DEPARTMENT OF INFORMATION SCIENCE AND ENGINEERING

NEW HORIZON COLLEGE OF ENGINEERING

(Autonomous College Permanently Affiliated to VTU, Approved by AICTE,
Accredited by NAAC with 'A' Grade & NBA)
Ring Road, Bellandur Post, Near Marathahalli,
Bengaluru-560103, INDIA

CERTIFICATE

It is to certify that the mini project entitled “Accounts Database” is carried out by Akhila S (1NH17IS008), a bonafied student of New Horizon College of Engineering, Bengaluru, in partial fulfillment of the requirements in the III semester of Bachelor of Engineering in Information Science and Engineering of the Visvesvaraya Technological University, Belgaum during the year 2018-2019. The project report has been approved as it satisfies the academic requirement in respect of mini project work.

Project Guide

Head of the Department

i
ABSTRACT

A Database management system is a collection of programs that enables you to store, modify and extract information from a database. The accounting department is responsible for maintaining all the cash transactions of a company. The main responsibilities of accounts department are generating payroll for all the employees, calculation of the income tax to be paid by every employee and budgeting. Though considered "back office" activities, the functions of an accounting department are essential to the proper functioning of an organisation. Hence a proper accounts database is needed.

Previously accounting was entirely based on manual methods which have some flaws like accuracy. Experienced and skilful accountants were required to do the entire manual calculations. This problem is overcome by the usage of a database where all the evaluation is done in the computer with a good accuracy.

The implementation of the accounts database is done using C programming using the concepts of structures.

ACKNOWLEDGEMENT

Any achievement, be it scholastic or otherwise does not depend solely on the individual efforts but on the guidance, encouragement and cooperation of intellectuals, elders and friends. A number of personalities, in their own capacities have helped me in carrying out this mini project. I would like to take this opportunity to thank them all.

I thank the management, **Dr. Mohan Manghnani**, Chairman, New Horizon Educational Institutions for providing necessary infrastructure and creating conducive environment for effective learning.

I also record here the constant encouragement, support and facilities extended to us by **Dr. Manjunatha**, Principal, New Horizon College of Engineering, and Bengaluru.

I extend sincere gratitude for constant encouragement and facilities provided to us by **Dr. R.J Anandhi**, Professor and Head of the Department, Department of Information Science and Engineering, New Horizon College of Engineering, Bengaluru.

I sincerely acknowledge the encouragement, timely help and guidance to me by **Prof. Prkruthi S T**, Assistant Professor, Department of Information Science and Engineering, New Horizon College of Engineering, Bengaluru, to complete the mini project within stipulated time successfully.

Finally, a note of thanks to the teaching and non-teaching staff of Information Science and Engineering Department for their cooperation extended to us and our friends, who helped me directly or indirectly in the successful completion of this mini project.

Akhila S

Chapter 1

INTRODUCTION

Accounts Database of an organization is used to maintain all the financial transactions of an organization. Some of the responsibilities of the accounts department are accounts payable, payroll, budgeting, financial controls. In this project we generate the pay slip/payroll for all the employees of the organization.

1.1 Motivation of Project

The purpose of creating an accounts database is to evaluate and store the salary of all the employees in an organization which makes the work easier for the accounts department.

The database we are creating is not only used for evaluating or storing the employee salary but the data is also used by the HR department to give bonus to the employees. If we look at the traditional methods, we understand that manual approach is needed, where all the calculations are written down in a piece of paper and the calculations are done. The drawback of doing these kind of calculations manually will result in error and one small mistake may change the final answer.

The computerized accounting of data offers unlimited storage of memory and the information retrieval is also easy. It is one of the best improvements of the traditional book keeping method.

The data is stored in the form of tables which has proven easy to comprehend and effective in the long run.

The organization must maintain proper records of all the transactions taking place so that it might be useful for future references.

Hence the accounts department makes use of the database to make all the evaluation, storage easy. It also provides access to other department so that they can do the necessary evaluation.

The project is implemented using the concept of files and structures using C programming.

1.2 Problem statement

To design and implement a database which generates the payroll/salary and the amount of tax to be paid by the employees in an organization.

Chapter 2

SYSTEM REQUIREMENT SPECIFICATION

Purpose: The purpose of the project is to provide accounts database to companies/organizations to store and evaluate their crucial data. In this project we calculate the payroll/salary of every employee based on their basic salary, the concessions and the tax they have to pay.

2.1 Hardware System Configuration:

Processor	- Intel PentiumM
Speed	- 1.8 GHz
RAM	- 256 MB (min)
Hard Disk	- 1 GB

2.2 Software System Configuration:

Operating System	- Windows
Programming Language	- C
Compiler	- Turbo C outcomes

Chapter 3

METHODOLOGY

3.1 Algorithm

Step 1: Start

Step 2: Create a structure with employee details like employee ID, employee name, and employee basic salary

Step 3: Input the number of employees

Step 4: Open a file in write mode using a file pointer emp

Step 5:for i=1 to n

 Input emp ID,emp name,basic

 Close the file

Step 6: Open the file in read mode using a file pointer emp

Step 7:for i=1 to n

 Display emp ID,emp name,basic salary

Step 8: Evaluate

$da = 0.35 * \text{basic}$

$hra = 0.45 * \text{basic}$

$gs = \text{basic} + da + hra$

$ags = gs * 12;$

Step 9 : if $ags < 250000$

 Display “no tax”

 else if $ags \geq 250000$ and $ags < 500000$

$\text{tax} = 0.05 * \text{ags}$

$\text{ns} = \text{ags} - \text{tax}$

else if $\text{ags} \geq 500000$ and $\text{ags} < 1000000$

$\text{tax} = 0.20 * \text{ags}$

$\text{ns} = \text{ags} - \text{tax}$

else

$\text{tax} = 0.30 * \text{ags}$

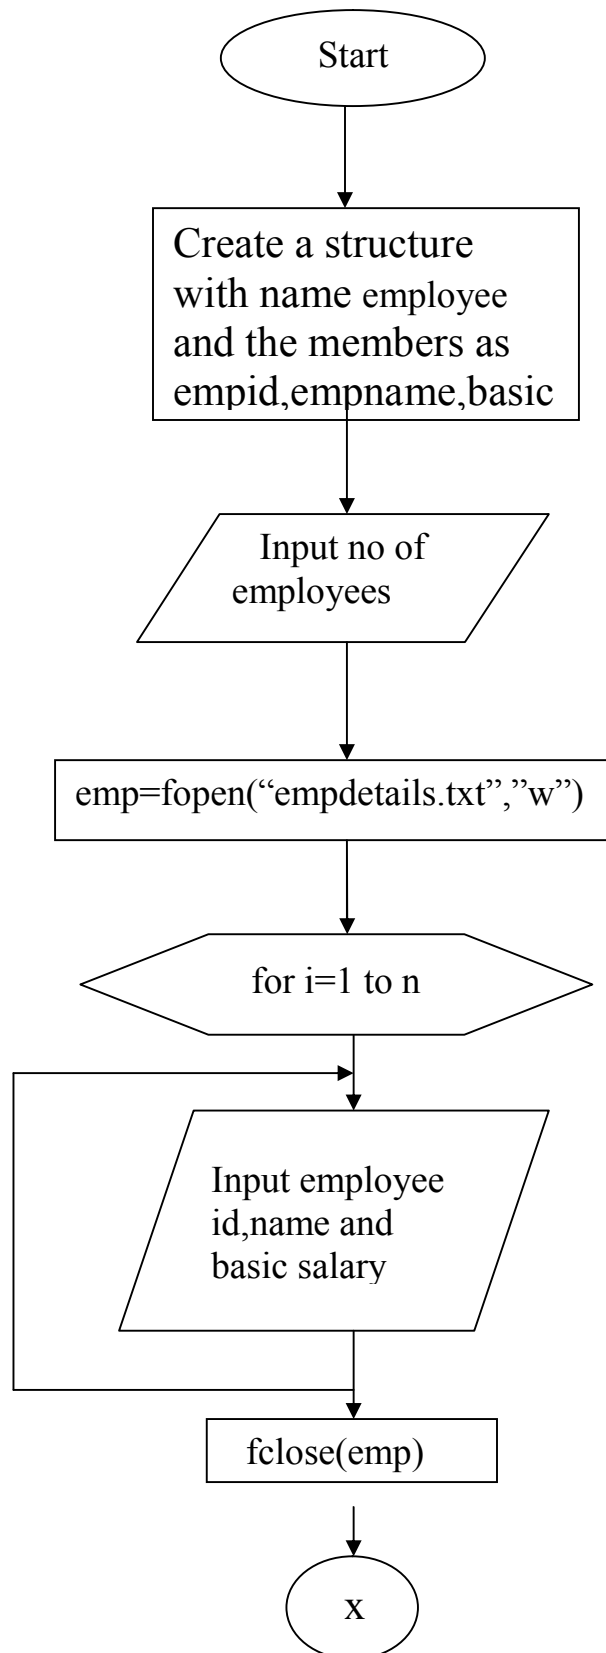

$\text{ns} = \text{ags} - \text{tax}$

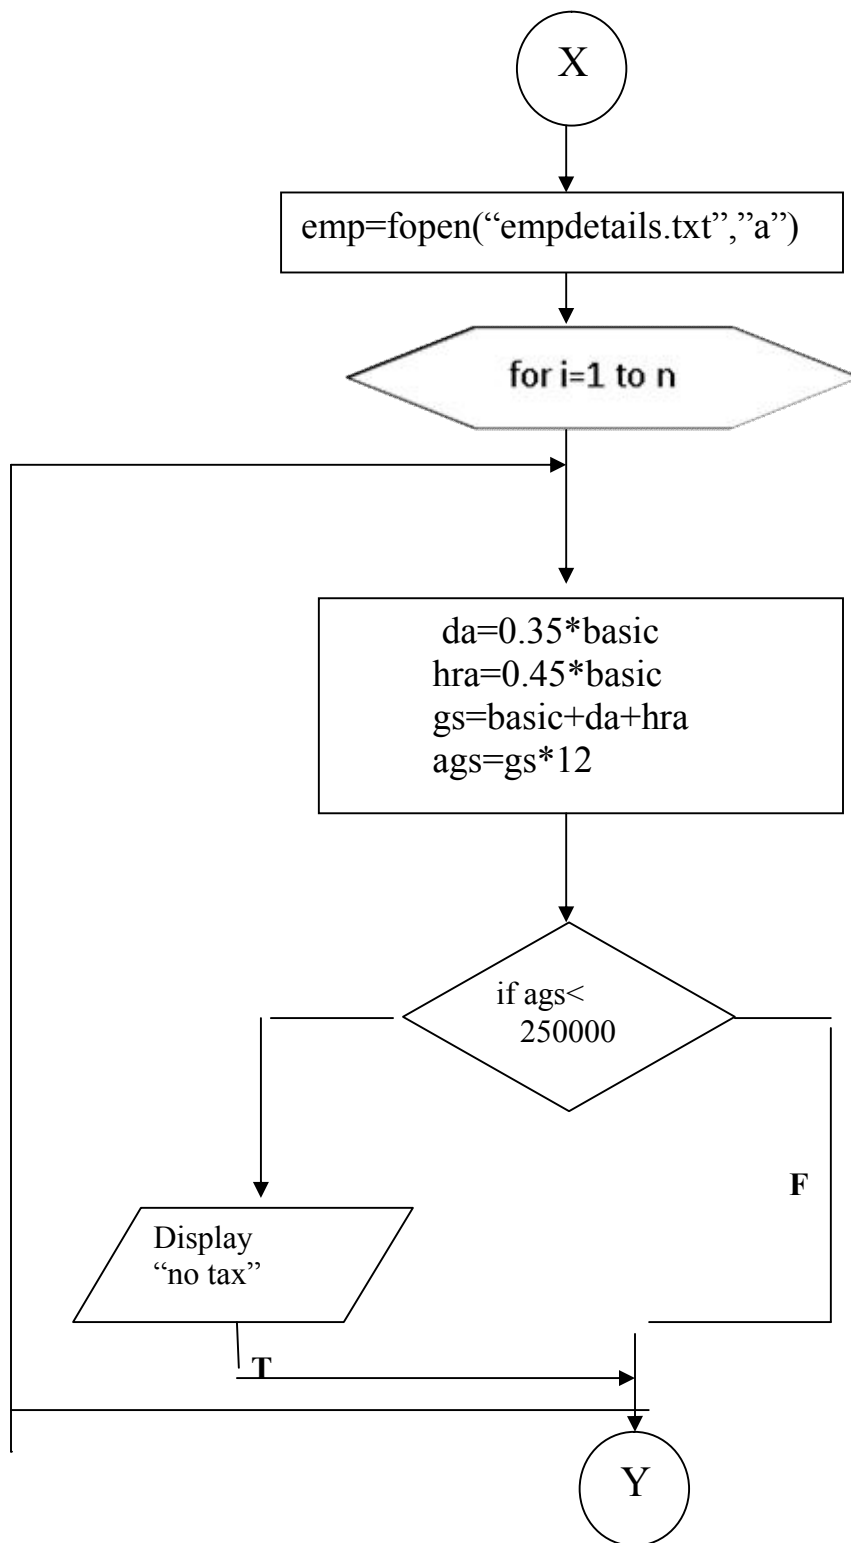

Step 10: Display the net salary and the tax to be paid

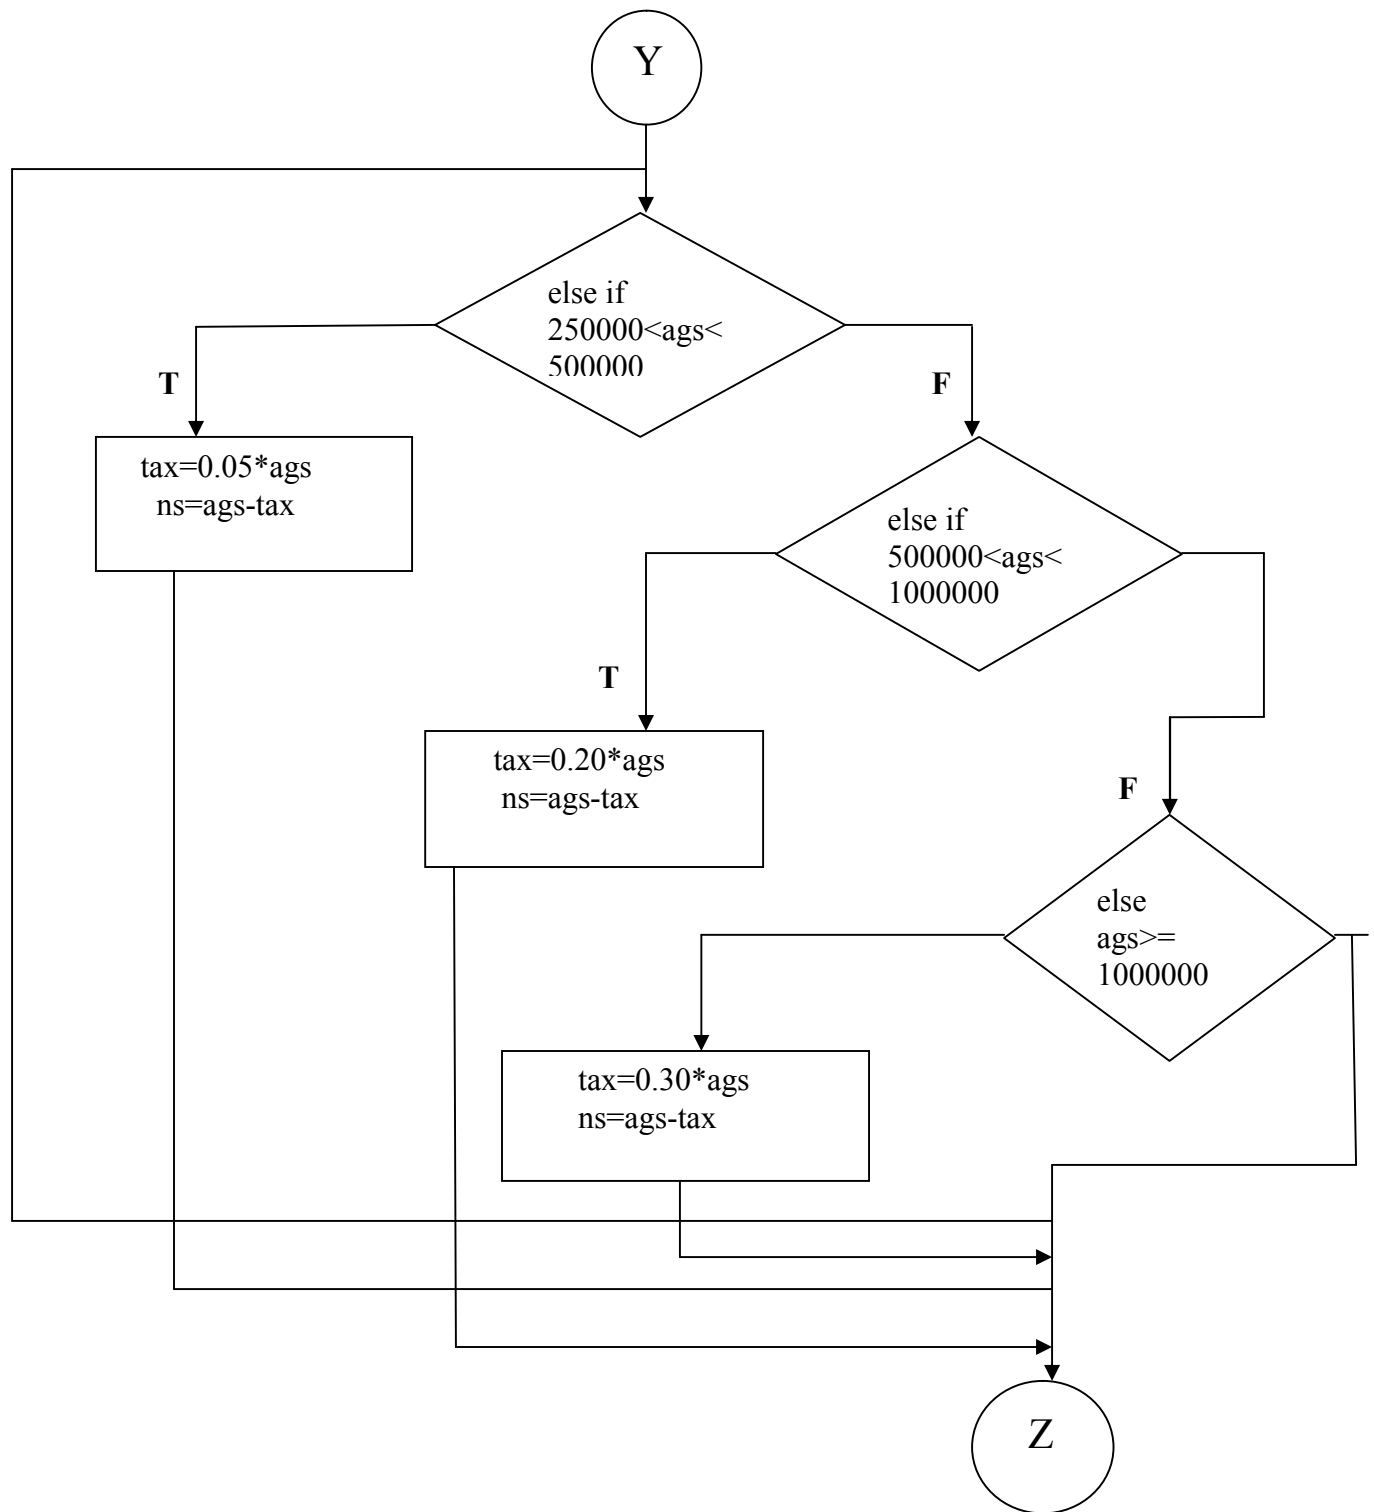

Step 11: Close the file

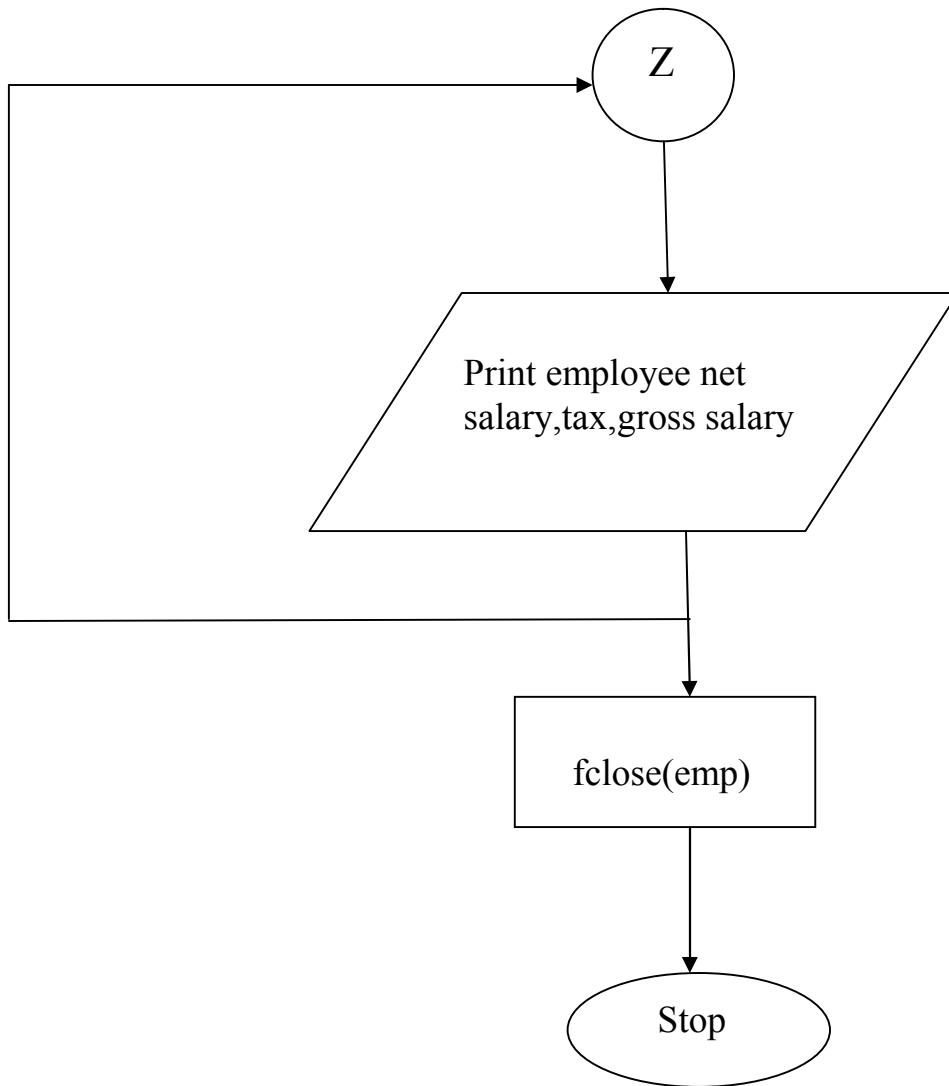

Step 12: Stop

3.2 Flowchart

3.3 Code and Implementation

```
#include<stdio.h>

struct Employee
{
    char empid[20];
    char empname[50];
    float basic;
};

int main()
{
    struct Employee Sal;
    FILE *emp;
    int n,i,j;
    float DA,HRA,PF,EPF,GS,NS,AGS,tax;
    printf("\n Enter the Number of Employees \n");
    scanf("%d",&n);
    emp= fopen("empdetails.txt","w");
    for(i=1;i<=n;i++)
    {
        printf("\nEnter Employee Number.\n");
        scanf("%s",Sal[i].empid);
```

```

printf("Enter Employee Name.\n");

scanf("%s",Sal[i].empname);

printf("Enter Employee Salary.\n");

scanf("%f",&Sal[i].basic);

}

fclose(emp);

emp= fopen("empdetails.txt","r");

for(i=1;i<=n;i++)

{

    DA=0.35*Sal.basic;

    HRA=0.45*Sal.basic;

    GS=Sal.basic+DA+HRA;

    AGS=GS*12;

    if(AGS<=250000)

    {

        printf("\n no tax to be paid");

        NS=AGS;

    }

    else if(AGS>250000&&AGS<500000)

    {

        tax=0.05*AGS;

        NS=AGS-tax;

    }

    else if(AGS>=500000&&AGS<1000000)

```

```

        {

            tax=0.2*AGS;

            NS=AGS-tax;

        }

    else

        {

            tax=0.3*AGS;

            NS=AGS-tax;

        }

    printf( "\n emp id \t emp name \t emp basic \t gs \t tax \t ns \n" );

    printf( "%s \t %s \t %f \t %f \t %f \t %f \n",

            Sal.empid, Sal.empname, Sal.basic, GS, tax, NS);

}

fclose(emp);

return 0;

}

```

Chapter 4

RESULTS AND DISCUSSION

4.1 Explanation

The output of the program gives us the payroll of each employee and the tax to be paid. The gross salary of each employee is calculated after including all the allowances like DA (Dearness Allowance), HRA (House Rent Allowance) with the basic salary. Then the net salary is calculated after deducting the tax from the annual gross salary. The tax is calculated based on certain conditions.

4.2 Output (Snapshots)

The following output generates the payroll of 6 employees.

```
Enter the Number of Employees
6

CONCLUSION AND FUTURE ENHANCEMENTS

The accounts database which generates the payroll for all the employees is written using C Programming using the concepts of array of structures.

NoSQL is all the rage, and many people are considering a move to NoSQL database systems. Database users sense that relational database systems are yesterday's technology and NoSQL is the future. NoSQL is not a single technology. Specifically, it is an anti-technology: Any database technology that does not use the SQL query language can be called NoSQL. Depending on the NoSQL database you choose, you might get better performance, better write scaling, or a database language that more closely matches your application language.
